

PARDUS MEADOW FESCUE

The Crop

Pardus is a medium maturing meadow fescue that combines very good yield potential throughout the growing season with strong resistance to diseases (especially that of rust and leaf spot). It grows very well under cool moist conditions, tolerating wet and sometimes flooded soils. Pardus has excellent quality, forms a thick sward and is an excellent choice for pasture or used as the grass component with alfalfa for hay or haylage.

Application & Mangement

- Excellent component for pasture mixes in northern regions of the US and Canada especially in areas of wet soils
- Excellent for mechanical harvest in grass / alfalfa mixtures especially where high quality forage is needed
- **Planting Depth:** 1/4 - 1/2 inch

Features

- Excellent disease resistance
- Tolerates wet soils
- Excellent seedling vigor
- High quality

Benefits

- Improved persistence and longevity
- Excellent forage where other grass species won't grow
- Rapid ground cover to reduce weed competition
- Improved animal production
