

ELODIE

Soft-Leaved Forage Tall Fescue

The Crop

Elodie is a soft-leaved, medium-late maturing, endophyte free tall fescue that was developed for its soft leaved nature and excellent disease resistance. Elodie has rapid shoot and leaf development in the spring and it forms a very dense sward of highly persistent forage. Elodie is a good alternative to other forage grasses in both dry and wet soil conditions. It is an excellent partner with alfalfa or clover for hay or silage production as well as for livestock grazing.
